Coconut foliar decay virus DNA, clones NMORG, poRG, and poRGSAU3

Coconut foliar decay virus

Viruses; ssDNA viruses; Nanovirus.

I (bases 1 to 1.29.1)

Rohde, W., Randles, J.W., Langridge, P. and Hanold, D.

Nucleotide sequence of a circular single-stranded DNA associated with coconut foliar decay virus

Virology 176, 648-651 (1990)

2 (bases 1 to 1004)
Ten distinct circular ssDNA components, four of which encode
putative replication-associated proteins, are associated with the
fibab bean necrotic yellows virus genome
J. Gen. Virol. 79 (Pt 12), 3101-3109 (1998)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /function="putative replication associated (rep) protein"

                                                                                                                                                                                                                                                                                                                                                                                                           This represents the nucleotide sequence of a banana bunchy top virus (BBTV) DNA II (clone 2-17) circular single stranded (css) DNA. The invention provides nucleic acid sequences associated with BBTV that can be used in a PCR technique for detecting BBTV. The nucleic acid sequences (AAV71830 to AAV71833) are used as the basis for the construction of PCR primers, to detect BBTV infection. The PCR technique is used for detecting BBTV in plant tissues (preferably banana, especially Musa species). The virus, one of the most important banana species viruses, causes phloem damage and is transmitted by aphids. PCR detection gives accurate, reliable and specific determination of absence or presence of the virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              551 atcgaaggtgttcctgatgatcgaagtatcatctgggtatacggtcccaacggaggcgaa 610

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This represents the nucleotide sequence of a banana bunchy top virus (BBTV) DNA II (clone 2) and reperesents a subgenomic DNA. The invention provides nucleic acid sequences associated with BBTV that can be used in a PCR technique for detecting BBTV. The nucleic acid sequences (AAV71830 to AAV71833) are used as the basis for the construction of PCR primers, to detect BBTV infection. The PCR technique is used for detecting BBTV in plant tissues (preferably banana, especially Musa species). The virus, one of the most important banana specially wiruses, causes phloem damage and is transmitted by aphids. PCR detection gives accurate, reliable and specific determination of absence or presence of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acids having banana bunchy top virus component sequences used to design primers for use in polymerase chain reaction

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to DNA promoter sequences derived from components of Banana Bunchy Top Virus (BBTV). The DNA molecule includes a promoter sequence derived from an untranslated portion of any one BBTV components and is adaptable for promoting transcription of a cloned gene in a plant cell. The promoter, included in a DNA chimeric vector, is useful for the expression of a gene in a plant cell. The inclusion of the polyubiquitin (ubil) intron sequence into BBTV promoter constructs enhances promoter activity. The present sequence represents the DNA sequence of BBTV S21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 gggaagtccgtgtttgccaaatatctcggactcaagcccgactggttctacacatgtggt 120

The invention provides nucleic acid sequences associated with BBTW that can be used in a PCR technique for detecting BBTW. The nucleic acid

sequences (AAV71830 to AAV71833) are used as the basis for the construction of PCR primers, to detect BBTV infection. The PCR technique is used for detecting BBTV in plant tissues (preferably banana, especially Musa species). The virus, one of the most important banana species viruses, causes phloem damage and is transmitted by aphids. PCR detection gives accurate, reliable and specific determination of absence

                                                                         associated with banana bunchy top virus (BBTV) and the encoded proteins. Also described is a method of detecting the BBTV virus using the polymerase chain reaction (PCR). The present sequence represents a BBTV related nucleotide sequence from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              δ
                                                                                                                                                                                                                           The subterranean clover stunt virus (SCSV) genome has at least 7 distinct ssDNA components, designated segments 1-7 (AAT13160-66), each contg. 1 major open reading frame and a non-coding region. Segment 6 is predicted to be a viral replication-associated protein gene. Genetic constructs useful in the genetic engineering of plants (esp. legumes) comprise 1 or more heterologous gene(s) operatively linked to a promoter region, and in some cases also a terminator region, selected from segments 1-7. The transcription regulators facilitate expression of foreign genes in plants and also facilitate control of levels of gene expression in different plant tissue types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                829 atgtaattgtgtttgcaaatgtactcccagatttgggaaaattaagtgaagatagaataa 888

The subterranean clover stunt virus (SCSV) genome has at least 7 distinct ssDNA components, designated segments 1-7 (AAT13160-66), each contg. 1 major open reading frame and a non-coding region. Segment 2 is predicted to be a viral replication-associated protein gene. Genetic constructs useful in the genetic engineering of plants (esp. 16 promoter region, and in some cases also a terminator region, selected from segments 1-7. The transcription regulators facilitate expression of foreign genes in plants and also facilitate control of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                856 gtgtttgccaacgtggcacctgaccccacgcgcataagtgaggacagacttgtaattatc 915

The invention relates to DNA promoter sequences derived from components of Banana Bunchy Top Virus (BBTV). The DNA molecule includes a promoter sequence derived from an untranslated portion of any one BBTV components and is adaptable for promoting transcription of a cloned gene in a plant cell. The promoter, included in a DNA chimeric vector, is useful for the expression of a gene in a plant cell. The inclusion of the polyubiquitin (ubil) intron sequence into BBTV promoter constructs enhances promoter activity. The present sequence represents the DNA sequence of SI promoter fragment derived from BBTV-SI and includes an open reading frame fragment
                                                                                                                                                                                                            DNA sequence of BBTV S1 promoter fragment including an ORF fragment.
                                                                                                                                                                                                                                             Promoter; Banana Bunchy Top Virus; BBTV; gene transcription; ubil;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Intergenic regions (AAT49399-409) are derived from genomic DNA components 1-6 (see also AAT49386-90) of banana bunchy top virus (BBTV). A large intergenic region (AAT449405) comparises the insert in plasmid pBT1.1NT, a plasmid obtd. by PCR amplification (see also AAT49427-28) of a full-length BBTV1 clone and cloning of rag1-digested PCR product into pBII01.3. BBTV intergenic regions are useful for promotting, enhancing, regulating or modifying transcription of non-BBTV genes in monocotyledon or dicotyledon transgenic plants. The non-BBTV gene is e.g. an insecticide resistance gene, herbicide resistance gene or growth promoting
                                                                                                                                                                                                                 Banana bunchy top vírus DNA intergenic region 1 insert in pBT1.1NT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   7.6%; Score 59.6; DB 18; Length 982; 52.6%; Pred. ```

```
This sequence represents a DNA fragment from the component 1 of the Banana bunchy top virus (BBTV). The DNA molecules can be used as diagnostic probes or primers or can be inserted into plants or other organisms e.g. to produce virus-resistant plants or to act as promoters, enhancers or termination signals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    736 gtagactgtataattacgaggatat----tgttatatitgatattccaagatgcaaag 789

The DNA molecules can be used as diagnostic probes or primers or can be inserted into plants or other organisms e.g. to produce virus-resistant plants or to act as promoters,

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                1 atcggagagccagcggacga......ccccaacctctgctaaccc 781
